        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DB

The specification describes chimeric polypeptides, which comprise at least one SCHAG (self-coalesces into higher-order aggregates) amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker protein, a glutathione-S-transferase or a staphylococcal nuclear protein, a The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a call. e.g. for ment therapy, noted nordention.
                                                                                                                                                                                              SCHAG; self-coalesce; higher-order aggregate; amyloidogenic domain; aggregation; fibril; phenotypic alteration; gene therapy; disease resistance; plant pigmentation; prion disease.

AAB30821-23 represent putative prion proteins which have been CC identified from a yeast protein database. The specification describes chimeric polypeptides, which comprise at least one SCHAG (self-CC coalesces into higher-order aggregates) amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker CC protein, a glutathione-S-transferase or a staphylococcal nuclear CC protein). The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a cell, e.g. for gene therapy, protein production, imparting disease resistance to plants, altering plant pigmentation and for diagnosis and treatment of prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        properties,

The XA proteins comprise an amino acid sequence less than 97% identical to a naturally occurring Bacillus circulans xylanase. They are modified to exhibit enhanced thermophilicity, alkalophilicity or thermostability relative to the naturally occurring B. circulans xylanase. They may be used as

It was used as a template for the synthesis of an oligo primer which was further utilised for the isolation of a hybridising AGP gene from both N. alata and N. plumbaginafolia. Degenerate reverse primers corresp. to part of the AGP N-terminal AA sequence were synthesised and used to obtain a 160 bp primer extension product, which was then amplified by PCR. Additional primers, corresp. in sequence to parts of the 160-bp fragment were synthesised and used to amplify the 3' part of the AGP gene by nested PCR. The primers were AAQ92536 and AAQ92537. A 1.6 kb fragment was amplified and sequenced. The alignment of the sequences obtd. from the two PCR reactions gave rise to a DNA sequence shown. The PCR fragment encodes a groterise to a DNA is periode (AAR75513) by protein sequencing with two mismatches the PCR sequences after the AAQ92524 FT). The 1.6 kb PCR fragment was used to screen a cDNA library made from RNA isolated from N. alata cells. The alignment of the PCR sequences with the cDNA sequence gave rise to aAQ92524
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

fungicide; and ophthalmological. The polynucleotides and proteins can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin againg due to sunburn, to maintain organs before transplantation, for
                                                     supporting cell culture of primary tissues, to regenerate tissues and chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, AAF2364 to AAF2372 and AAB63133 represent sequences used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                         and polypeptides homologous to them. Human secreted proteins have activities based on the tissues and cells the genes are expressed Examples of activities include: immunosuppressive; antiarthritic;

                                                                                                                                                                                                                                                                                                                                                                                                      DNA binding region of which may be mutated by replacing one or more amino acids. This allows inhibition, prevention or control of DNA binding and thus activation of genes controlled by the protein can be controlled.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                  proteins. The receptor proteins were used to design polypeptides, pref. based on the transmembrane domains, for use in G-protein coupled receptor ligand binding assays. The polypeptide fragments retain biological activity such as binding a GPR ligand or modulating GPR ligand binding to a GPR (see AAW02747-W02999 for examples of polypeptide fragments). The polypeptide fragments can be used in compositions for treating subjects suffering from a pathology related to a GPR abnormality e.g. a psychotic disorder such as schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    schizophrenia; dopamine; cAMP; adenosine; thromi muscarinic acetylcholine; endothelin; bombesin; odorant; cytomegalovirus; serotonergic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    G-protein coupled receptor; ligand binding assay; transmembrane schizophrenia; dopamine; cAMP; adenosine; thrombin; adrenergic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (GPR) proteins selected from cAMP, adenosine, muscarinic acetylcholine, adrenergic, thrombin, endothelin, bombesin, endocrine, rhodopsin, opsin, odorant, cytomegaloviral and other GPR proteins. The peptides AAW03578-W03651 represent the N-terminal fragments of the above
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      09-SEP-1993;

                                                                                                                                                The present invention describes a method for inhibiting the formation aggregates of certain proteins, involving contacting the protein with binding molecule known as an intrabody. Proteins to be bound include those associated with neurological disorders, and so the method can be used in the prevention of diseases such as Alzheimer's, Parkinson's an Huntington's diseases, prion disease, frontotemporal dementia, amyotrophic lateral sclerosis, spinal and bulbar muscular atrophy, dentatorubal pallidoluysian atrophy, spinocerebellar ataxia type 1 (SCA1), SCA2, SCA3, SCA4, SCA5, SCA6 and SCA7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Parkinson's disease; prion disease; frontotemporal dementia; amyotrophic lateral sclerosis; spinal and bulbar muscular atrophy; dentatorubal-pallidoluysian atrophy; spinocerebellar ataxia type 1; SCA2; SCA3; SCA4; SCA5; SCA6; SCA7; protein accumulation; intrabody

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT
                             The present invention provides the protein and coding sequences of two human nuclear factors associated with dsRNA (NFAR-1 and NFAR-2). These are transcriptional regulators and aire thought to play a role in apoptosis and tumourigenesis. The coding sequence (found on chromosome 19p13.1-13.2) is useful as a probe to detect rearrangements in tumour cells and the protein is useful for determining structure-function
                                                                                                                                      Novel isolated human nuclear factor associated with dsRNA polypeptide useful for determining structure-function relationships and as affining to identify and isolate interacting proteins that bind to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                          amino acid sequence fused in frame with a polypeptide of interest (which is other than a marker protein, a glutathione-S-transferase or a staphylococcal nuclear protein). The specification also describes chimeric polypeptides that comprises an amyloidogenic domain that causes aggregation into fibrils. The chimeric polypeptides are used to prepare polymers with multiple reactivities, e.g. derivatised with enzymes, or specific binding partners, and useful e.g. for performing multi-step chemical reactions. They can be used create an inducible, or stable
                                                                                                                                                                                               The present sequence represents a modified N region of Sup35 protein, in the second oligopeptide repeat has been expanded twice, creating a total of seven repeats. Sup35 possesses the prion-like capacity to undergo a self-perpetuating conformational alteration that changes the functional state of Sup35 in a manner that creates a heritable change in phenotype. It is used to construct chimeric polypeptides of the invention, which comprise at least one SCHAG (self-coalesces into higher-order aggregates)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gene
              pigmentation
                          chemical reactions. They can be used create an inducible, or stable phenotypic alteration in a cell, e.g. for gene therapy, protein production, imparting disease resistance to plants, altering plant
                                                                                                                                                                                                                                                                                                                                            Claim 11;
                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid encoding chimeric proteins with self-assembly properties, useful e.g. for diagnosis and treatment of prion diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lindquist S,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-JUN-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         160 bp primer extension product, which was then amplified by PCR.

Additional primers, corresp. in sequence to parts of the 160-bp

C fragment were synthesised and used to amplify the 3' part of the

CAP gene by nested PCR. The primers were AA092536 and AA092537. A

1.6 kb fragment was amplified and sequenced. The alignment of the

Sequences obtd. from the two PCR reactions gave rise to a DNA

sequences obtd. from the two PCR reactions gave rise to a DNA

sequences shown. The PCR fragment encodes a protein conty.

the peptide (AAR75513) by protein sequencing with two mismatches

(see AA092524 FT). The 1.6 kb PCR fragment was used to screen a cDNA

ilbrary made from RNA isolated from N. alata cells. The alignment

of the PCR sequences with the cDNA sequence gave rise to AA092524.

The calc. mol. wt. of the encoded protein is 51.8 kD with a

predicted pI of 3.84. An N. plumbaginafolia cells suspension cDNA

ibrary was also screened with the PCR fragment. The AAP gene was

designated NPAGP1 (see AAQ92525). The NPAGP1 was not identical but

very similar to the NBAGP1 at both the nt. and the derived AA

level It contains hydroxyproline residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The N-terminal region of an arabinogalactan protein (AGP) was obtd. from N. alata suspension culture. It was used as a template for the synthesis of an oligo primer which was further utilised for the isolation of a hybridising AGP gene from both N. alata and N.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim

These can be used to identitreatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaen and neurodegeneration. The present sequence is one of the C. albicans proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yeast and fungal nucleic acids encoding proteins involved in a pathway leading to programmed cell death, useful for treating proliferative disorders, yeast and fungal infections, or for preventing apoptosis in certain diseases -

                                                                                                                                                                                                                                                                                                         A polypeptide capable of inhibiting lymphocyte proliferation and/or ovarian androgen secretion comprises a plurality of segments, as indicated in the features. The segment may be repeated 2-10 times. In this example the segment is repeated 10 times. The N-terminal may comprise NH2 or a leader segment of 1-20 amino acids, the C-terminal comprises COOH or a tail segment of 1-20 amino acids. Between each segment is a first and second spacing segment of 1-20 amino acids. p(141-155) is a peptide obtained from apo E. see also AARII107 and AARII109.
